

Glossary

Purpose

This glossary explains the key terms used throughout the Sofia Engineering Specification in clear and practical language. It is intended to help readers understand Sofia's concepts without requiring a technical or engineering background.

Artificial Intelligence

Artificial Intelligence (AI)

Technology that enables computers to assist people with tasks that normally require human thinking, such as writing, organizing information, solving problems, and generating ideas.

AI Agent

An intelligent system designed to assist users by performing specific roles, solving problems, supporting decision-making, and helping accomplish meaningful work.

Large Language Model (LLM)

The underlying AI technology that understands natural language and generates human-like responses. Sofia is built upon Large Language Model technology.

Prompt

The instruction, question, or request given to Sofia. Well-structured prompts usually produce more accurate and useful responses.

Sofia Architecture

Architecture

The overall design of how Sofia is organized, how her components work together, and how she delivers assistance to users.

Capability

A specific function or task that Sofia is designed to perform.

Cognitive Architecture

The structured reasoning approach that guides how Sofia analyzes information, organizes ideas, and produces responses.

Engineering Specification

The official document describing Sofia's purpose, architecture, design principles, capabilities, and future direction.

Knowledge Base

A structured collection of information that enables Sofia to provide organized, consistent, and context-aware assistance.

Master Prompt

The primary instruction set that defines Sofia's identity, behavior, reasoning style, and response principles.

Repository

The online location where Sofia's documentation, prompts, and supporting project files are maintained.

Validation

The process of reviewing and confirming that Sofia's documented design and capabilities accurately represent the system's intended purpose.

Automation & Workflow

API (Application Programming Interface)

A method that allows different software applications to communicate and exchange information automatically.

Automation

The use of technology to perform repetitive tasks with minimal manual effort.

Dashboard

A visual workspace that organizes important information, reminders, project status, or business data in one convenient location.

Workflow

A step-by-step process describing how work moves from beginning to completion.

Webhook

A method that automatically sends information from one software application to another when a specific event occurs.

Sofia Concepts

Engineering Partner

The role Sofia is designed to perform by helping users organize ideas, evaluate options, solve problems, and develop practical solutions.

Human-in-the-Loop

A design principle in which people remain responsible for important decisions while Sofia provides analysis, recommendations, and decision support.

Professional Domain

A specific area of expertise in which Sofia is designed to provide structured assistance, such as business, administration, education, research, ministry, healthcare, or project management.

Reasoning

The process Sofia uses to analyze information, identify relationships, evaluate alternatives, and produce thoughtful recommendations.

Structured Thinking

A method of organizing ideas into logical, understandable, and actionable steps.

System Thinking

A method of understanding how different parts of a process, project, or organization work together as one complete system rather than as isolated tasks.

Guiding Principle

Throughout this Engineering Specification, technical concepts are explained in practical language because Sofia is designed to make technology more understandable and accessible to everyone.

Technology should make human potential bigger—not make humans feel smaller.
